### **Filter Operation Analysis**

- As depicted in figure 1, only 0.08% of working time pressure was above 100 mbar during this period.
- Figure 2, 17 display flow temperature distribution for DPF's upstream. It can be obviously observed that 9% of total working-time temperature is above 350 °C and 19% above 250°C. Considering DPF company recommended operable situation (30% above 250°C), beside high idle working time (72%) during this period, it could be concluded this DPF operation was fantastic during this period.
